

LAB 11 REPORT

Name: Muhammad Sohaib

Reg No: 2026(S)CYS52

Lab Title: List & Tuple

Theory:List & Tuple: Lists and tuples are used to store multiple values in a single variable in Python.

A **list** is changeable (mutable), while a **tuple** is unchangeable (immutable).

They are commonly used to organize and access collections of data efficiently.

TASK 1

```
list=["fruit:", "mango", "fruit:", "apple", "vegetable:", "brinjal"]  
print(list)
```

Output:

```
['fruit:', 'mango', 'fruit:', 'apple', 'vegetable:', 'brinjal']
```

TASK 2

```
list=["name:muhammad sohaib",  
      "age:18",  
      "cast:qaisrani",  
      "favtsub:programming fundamentals"]  
for i in list:  
    print(i)
```

Output:

```
name:muhammad sohaib  
age:18  
cast:qaisrani  
favtsub:programming fundamentals  
  
Process finished with exit code 0
```

TASK 3

```
students = (  
    ("Ali", 85, 90, 78),  
    ("Ahmed", 70, 88, 92),  
    ("Sara", 95, 91, 89)  
)
```

```
for name, m1, m2, m3 in students:  
    avg = (m1+m2+m3)/3  
    print(name, "Average:", avg)
```

Output:

```
Ali Average: 84.33333333333333  
Ahmed Average: 83.33333333333333  
Sara Average: 91.66666666666667  
  
Process finished with exit code 0
```
