

LAB 1 REPORT

Name: Muhammad Sohaib

Reg No: 2026(S)CYS52

Lab Title: I/O, Data Types and Conditional Statements in Python

Theory: I/O, Data Types, and Conditional Statements are basic concepts in Python programming. I/O (Input/Output) allows programs to take data from users and display results. Data types store different kinds of values, while conditional statements help programs make decisions.

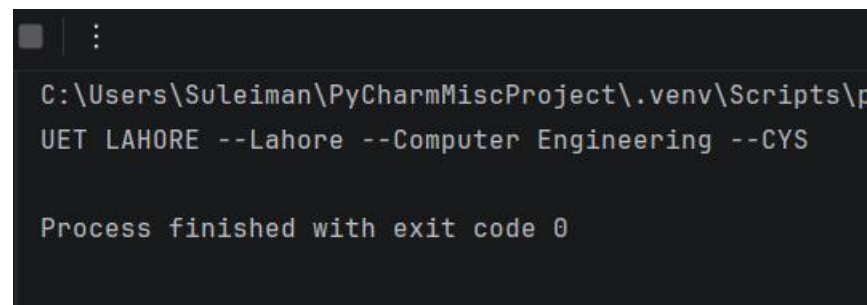

TASK 1

```
# TASK 1
def main():
    uni = "UET LAHORE"
    city = "Lahore"
    department = "Computer Engineering"
    field = "CYS"

    print(uni, city, department, field, sep=" --")

if __name__ == "__main__":
    main()
```

Output:

```
C:\Users\Suleiman\PyCharmMiscProject\.venv\Scripts\p
UET LAHORE --Lahore --Computer Engineering --CYS

Process finished with exit code 0
```

TASK 2

```
def main():
    uni="UET"
    city="Lahore"
    department="CE"
    field="CYS"
    print(uni,city,department,field,sep="-")
```

```
if __name__=="__main__":  
    main()  
Output :
```

```
C:\Users\Suleiman\PyCharmMiscProject\.venv\Scripts>python main.py  
UET-Lahore-CE-CYS  
  
Process finished with exit code 0
```

TASK 3

```
def main():  
    name="SOHAIB"  
    age=18  
    city="Lahore"  
    print("Name:",name)  
    print("Age:",age)  
    print("City:",city)
```

```
if __name__=="__main__":  
    main()
```

Output:

```
C:\Users\Suleiman\PyCharmMiscProject\.venv\Scripts>python main.py  
Name: SOHAIB  
Age: 18  
City: Lahore  
  
Process finished with exit code 0
```

TASK 4

```
name="SOHAIB"  
age=18
```

```
print("Name:",name)  
print("Age:",age)
```

Output:

```
Name: SOHAIB
Age: 18

Process finished with exit code 0
```

TASK 5

```
x=10
y=3.14
z=True
name="UET"
print(name)
print(type(x))
print(type(y))
print(type(z))
print(type(name))
print(len(name))
```

Ouput:

```
<class 'int'>
<class 'float'>
<class 'bool'>
<class 'str'>
3

Process finished with exit code 0
```

-----THE END-----
