

LAB 9 REPORT

Name: Muhammad Sohaib

Reg No: 2026(S)CYS52

Lab Title: While Loop

Theory: A **while loop** in Python is used to repeatedly execute a block of code as long as a given condition is true. It is useful when the number of repetitions is not fixed and depends on a condition. The loop stops when the condition becomes false.

TASK 1

```
n=5
while n>0:
    print(n)
    n=n-1
print("GO!")
```

Output:

```
5
4
3
2
1
GO!

Process finished with exit code 0
```

TASK 2

```
n=int(input("Enter a number: "))
while n%2==0:
    print(n,"is even")
    break
else:
    print(n,"is odd")
```

Output:

```
Enter a number: 25
25 is odd

Process finished with exit code 0
```

TASK 3

```
n=1
while n<6:
    print(n*"*")
    n=n+1
n=4
while n>0:
    print(n*"*")
    n=n-1
```

Output:

```
*
**
***
****
*****
****
***
**
*

Process finished with exit code 0
```
